```
Define a quantity from scalars and units:
>>> 15.1 * u.m / u.s
<Quantity 15.1 m / s>
Convert a distance:
>>> (1.15e13 * u.km).to(u.pc)
<Quantity 0.372689618289 pc>
Make use of the unit equivalencies:
>>> e = 130. * 11.eV
>>> e.to(u.Angstrom, equivalencies=u.spectral())
<Quantity 95.37245609234003 Angstrom>
Combine quantities:
>>> x = 1.4E11*u.km / (0.7*u.Myr) / (4.1E11*u.s)
<Quantity 0.487804878049 km / (Myr s)>
Convert to SI units:
>>> x.si
<Quantity 1.54576038117e-11 m / s2>
Convert to CGS units:
>>> x.cgs
<Quantity 1.54576038117e-09 Gal>
```
